Description

This 10 A high temperature Alternistor and Standard TRIAC series, offered in TO-220AB, TO-220 isolated, and TO-263 packages, has 150°C maximum junction temperature and 120 A I_{TSM} (60 Hz).

This series enables easier thermal management and higher surge handling capability in AC power control applications such as heater control, motor speed control, lighting controls, and static switching relays. Alternistor TRIAC operates in Quadrants I, II, and III, and offers high performance in applications requiring high commutation capability.

Features

- Recognized to UL 1557 as an Electrically Isolated Semiconductor Device
- Glass-passivated junctions
- Surge capability up to 120 A and 60 Hz
- L package UL recognized under E71639 for Electrical isolated at 2500 V_{RMS}
- No contacts to wear out from reaction of switching events
- Solid-state switching eliminates arcing or contact bounce that creates voltage transients
- Restricted (or limited) RFI generation, depending on activation point sine wave
- Requires only a small gate activation pulse in each half-cycle
- RoHS compliant

Applications

- Excellent for AC switching and phase control applications such as heating, lighting, and motor speed controls. Typical applications are AC solid-state switches, light dimmers, power tools, lawn care equipment, home/brown goods, and white goods appliances.
- Alternistor TRIACs (no snubber required) are used in applications with extremely inductive loads requiring highest commutation performance.
- Internally constructed isolated packages are offered for ease of heat sinking with highest isolation voltage.
- Standard type devices normally operate in Quadrants I & III triggered from AC line.

Design Considerations

Careful selection of the correct component for the application's operating parameters and environment will go a long way toward extending the operating life of the Thyristor. Good design practice should limit the maximum continuous current through the main terminals to 75% of the component rating. Other ways to ensure long life for a power discrete semiconductor are proper heat sinking and selection of voltage ratings for worst case conditions. Overheating, overvoltage (including dv/dt), and surge currents are the main killers of semiconductors. Correct mounting, soldering, and forming of the leads also help protect against component damage.
