DC POWER DISTRIBUTION

MARKET AND CUSTOM SOLUTIONS FOR VEHICLE DC POWER DISTRIBUTION
Local Resources for a GLOBAL Market

Littelfuse products help protect, control and distribute vehicle electrical power in OEM and aftermarket applications for industries such as heavy-duty truck, construction and agriculture. We offer a broad and reliable selection of fuses, fuse blocks, power distribution modules, high-current switches, relays and solenoids to fit your requirements.

For decades, we have helped OEMs, engineers and end-users select the right product for their applications. Today, Littelfuse offers the broadest range of products for protection, sensing, and control needs while providing exceptional service and support that our customers expect.

Over 90 Years of Electrical Power Expertise

1927 Founded Littelfuse

1955 Technology High-Current 2484 Switches

1986 Technology MINI® Fuses

2006 Technology Next Generation High-Current Switch

2009 Acquisition Integrated CAN/LIN Power Control Center

2010 Technology High Current FLEC PDM

2013 Acquisition Cole Hersee

2014 Acquisition TERRA Power Systems

2015 Technology Power Conversion Liftgate Battery Charger

2016

why choose littelfuse
Our Market Focus **INDUSTRIES** and Applications...

**Truck & Bus**
- On-Highway
- Severe Duty
- Transit Buses
- Vocational

**Material Handling**
- Fork Lifts
- Telehandlers
- Aerial Work Platform
- Pallet Jacks

**Construction**
- Loaders
- Skid Steers
- Excavators
- Cranes

**Municipality**
- Emergency
- Waste Trucks
- Fire & Rescue
- Utility

**Agriculture**
- Tractors
- Harvesters
- Lawn Turf
- Loaders

**Recreational Vehicle & Marine**
- Recreation Vehicles
- Boats & Marine
- ATV & Snowmobiles
- Golf Carts

Why Choose Littelfuse

Littelfuse is the global leader in circuit protection solutions with the broadest spectrum of electrical power technologies. Our Commercial Vehicle Products portfolio provides a total solution to protect, control and distribute vehicle electrical power.

**Single Source for Vehicle Electrical Products**
Littelfuse offers an extensive commercial vehicle product line. If an off-the-shelf product does not fit your needs, we can work with you to develop a customized solution that fits your application.

**Product Development and Testing Expertise**
Our global team of engineers design innovative solutions, provide customer support and perform product testing to ensure you have the best solution that meets all requirements and regulations.

**Global Support Team**
Littelfuse has a world-wide team of specialist prepared to support your application needs from conceptual development to continuous quality assurance for the lifetime of your program.

Littelfuse.com/PDM
Application Considerations

When specifying a power distribution module, your application should be the first area of focus. This can determine specific requirements that are crucial in selecting the right solution.

What is the Application?

Power distribution modules provide applications with centralized, safe power distribution, preventing excess downtime due to service. Generally, PDMs can be found on heavy-duty truck, agriculture, and construction equipment. With the advancement in telecom, PDMs are now being found in more places than just vehicles. From Class 8 tractors to data centers, PDMs are used to keep DC applications protected and powered safely.

Mounting Locations

Mounting locations and space restrictions can vary by application but can have a big impact on determining your available options.

Common Mounting Locations Include:

- Under Hood
- Chassis
- Battery Box
- Equipment Box
Electrical Considerations

Power Distribution Modules are installed into applications to ensure circuits are protected, controlled and/or sensed. These units’ primary focus is to protect and distribute current throughout an application. There are many variables that affect the selection of the right module for your application and these are the following considerations that should be taken prior to selecting your module.

Circuits
DC applications can have many powered accessories as features and benefits. These accessories need to be powered and/or controlled and PDMs are the ideal solution to protect, sense and control the desired applications through a centralized, safe location.

Voltage
Direct Current (DC), is electrical current that flows consistently in one direction. Common maximum application voltage is 32V DC, but with emerging electric vehicle popularity voltages are reaching up to 1,000V DC.

Amperage
A system’s amperage should be considered by total current and current per circuit. Total current will be controlled by a unit’s ability to disperse heat created by continuous current. Continuous and maximum current is the working amperage (individual circuit current de-rated by 70%). A PDM should have the proper amperage calculated to ensure proper system protection.

Bussing
The electrical bus is how the PDM moves current around the module. Common bussing can be:
- **Bus Bar**: a matrix of copper bars and connections to form a circuit
- **PCBA (Printed Circuit Board Assembly)**: PCBA traces make all connections
- **Hybrid**: Includes Bus Bars, PCBA and direct wiring

I/O
Also known as Input/Output, this term refers to the connection to a device. A PDM is used to protect and control electrical systems. Connections to these devices should allow mechanical and protective devices to be changed so that the module can last the life of the application.

Connector Type
Connectors can come in either standard or custom configurations. Custom terminals will be sculpted to fit the application and the module. This will allow users the most configurability with their harness selection. Standard connectors are off the shelf with better market availability.

Smart Connectivity
Smart Connectivity - better known as on-board micro processing is the ability to add bus based communications to your PDM. Some examples are CAN SAE J1939 and ISO 11898 high speed communications protocols, LIN and current sensors.

Devices / Components
- Fuses
- Relays
- Circuit Breakers/PTCs
- CAN/LIN Modules
- Current Sensing Components
Environmental Considerations

Littelfuse PDMs are developed and designed to operate in some of the harshest environments. Choosing the right environmental ratings for your PDM is an essential consideration that will directly affect the long-term performance on not only your PDM, but also your application.

**Ingress Protection (IP)**
IP Rating: a set of criteria a product is tested to in order to ensure its level of sealing

- IP65 will be sufficient in most cases if the PDM will be mounted in an enclosure
- If the PDM will be exposed to spray and splash, IP66/IP69K should be a minimum

**Shock**
Mechanical Shock is the sudden acceleration caused by impact. This should be considered when mounting your PDM and what potential impacts it may experience. Littelfuse PDMs are tested to industry standards for road vehicles to ensure durability of our products.

**Vibration**
Mechanical vibration is the consistent oscillation a product may experience. PDMs will mostly experience this when they are mounted close to an engine or motor. Littelfuse PDMs are tested to industry standards for road vehicles to ensure durability of our products.

**Connectors**
Connectors not only aide in power input and output, but also to the level of sealing protection for the total PDM. When selecting a sealed PDM, IP rated connections should also be considered if the Power Distribution Module requires an IP rating.
MDB5 Power Distribution Module
Sealed High Current Centralized Circuit Protection

Designed to handle standard voltage (32V) and the new 70V (48V application) MIDI® and MEGA® fuses. Configurable inputs allows for flexibility between high and low current applications.

Dual inputs allow for 400A continuous current
IP67/69K can be achieved with the use of cable seals or plugs
All connections are protected by sealed enclosure

Available Q4 2020

What is a semi-custom PDM?

Sometimes an off-the-shelf solution will not meet the needs of your application. In these instances, a semi-custom PDM may be the right solution to your design challenges. A semi-custom PDM means alterations to an existing market PDM that can consist, but is not limited to the following:

Custom Labels
Custom labels are some of the most common alterations that can be made to a PDM. These labels are used to identify circuits keeping maintenance downtime to a minimum.

PCB Board Spins
The advantage of a PCBA is the ability to have all your circuits “traced” on one board. A board spin will incorporate all desired circuits to one centralize device.

Grid Changes
Grid changes allow for off-the-shelf solutions to be tailored to specific application requirements. Changing grid layout, allows for the addition or removal of required components, without a ground up design.

Custom PDM Development

When a market or semi-custom solution will not meet your applications needs, it is then time to design a custom application specific Power Distribution Module. Custom solutions will be tailored to exact application requirements.

Benefits of a Custom PDM:
- Custom Connectors tailor to your application’s harness
- Design to fit in specific locations
- Tailored circuitry to protect, control and sense all required circuits
- Smart micro-processing can be added via CAN/LIN bus protocols

Requirements to Consider:
- Specialized tooling costs
- Design Non-Recurring Expenses
- Testing and validation costs

For more information or to request a consultation:
info.littelfuse.com/custom-power-distribution-modules
Combine High and Low Current Components
Simple and cost effective solution for high and low current circuits.

Smart Control: Integrated CAN / LIN Interface
Support CAN (LIN or J1939) protocols for on-board microprocessing.

High Current Capabilities
Expertise in design and production of high current system solutions.

High-Current Relay Integration
Eliminate cost and liability of connecting external high current relays for power control.

Custom Labeling
Minimize maintenance and downtime with Individual circuit identification.

Connectors
Best in class connection systems for sealed, efficient and safe power transfer.

Environmental factors play a huge role in a product’s ability to do its job and survive the lifetime of the equipment. Ingress Protection, or IP, indicates the degree of protection of a power distribution module. IP ratings are a measure of how resistant a part is to environmental contaminants such as debris, dust, and water. IP rating selections should be based on where the PDM will be mounted and what type of environment the equipment will be used in.

The numbers following IP represent levels of sealing and can range from no sealing (IP00) to protection against dust and continuous immersion in water (IP68). The table below provides a description of the protection at each level.

<table>
<thead>
<tr>
<th><strong>1st Digit - SOLID</strong></th>
<th><strong>2nd Digit - LIQUID</strong></th>
</tr>

KEY TERMS AND DEFINITIONS

Amp/Amperage – The strength of an electric current in Amperes (the basic unit of electrical current in the International System of Units).

Connectorized – Products that have an existing, integrally molded, female or male market available connector.

High Current – Nominal current range above 60A 32 VDC

Low Current – Nominal current range below 60A 32 VDC

Harsh Environments – Shock or vibration ratings in addition to IP or Ingress Protection ratings a product can be rated to.

Bussing – Slang term used to describe the method or configuration that is used to distribute power throughout a module.

Busbar – In electric power distribution, a busbar (also bus bar) is a metallic strip or bar, typically housed inside switchgear, panel boards, and busway enclosures for local power distribution.

PCBA (Printed Circuit Board Assembly) is the board obtained after all printing solder paste on the PCB and then mounting various components like resistors, ICs (Integrated Circuits), capacitors and any other components like transformers depending on the application and desired characteristics of the board.

Voltage – is what makes electric charges move. It is the ‘push’ that causes charges to move in a wire or other electrical conductor.

Fuse Types – Denotes which variant of automotive fuse is accepted in a module.

Relay Types – Denotes which variant of Automotive relay is accepted in a module.

AssureLatch™ – Littelfuse latch technology ensuring “worry-free” positive latching with an audible “click.”

Circuit – The path over which an electrical charge flows.

Continuous Rating – The rating meant to indicate what the device can handle forever with no interruption. It is usually measured as the amperage that a device can handle for one hour without exceeding the maximum allowed temperature rise at the terminals.

Inrush Rating – The short duration rating of the switch. This rating is meant to reflect the ability of the switch to withstand a short term, high current event like starting. A large diesel engine starting in cold weather can draw close to 2000A for about 30 seconds.

IP Rating – IP Rating - Formally known as an International Protection rating, but often referred to as Ingress Protection, this rating determines the resistance of a device to environmental contaminants

Short Circuit – An abnormal low resistance path between two polarities, or polar opposite, circuits. It will likely be accompanied by overheating, an explosion, or fire. A short-circuit is also likely to cause damage to components or equipment in that circuit.

Terminals – A reusable interface creating a point where external circuits can be connected. Terminals can be connected at the end of a wire and consist of either connectors or fasteners.

Common Applications...

AGRICULTURE
- Tractors
- Harvesters

CONSTRUCTION
- Excavators
- Loaders

MATERIAL HANDLING
- Fork Lifts
- Telehandlers
- Pallet Jacks
Need **MORE INFORMATION** about Commercial Vehicle Products?

Littelfuse publishes technical documents to help in the design and selection of products for your electrical systems. To learn more about a specific product or application, visit our online library at: Littelfuse.com/Commercial-Vehicle-Technical-Center

- Product Datasheets
- Application Notes
- CAD Drawings
- 2D Outlines
- 3D Models
- Glossary
- FAQ

**Littelfuse.com/Catalogs**

Littelfuse offers digital and printed catalogs, to request a copy, please contact Littelfuse or download the digital version on our website.

Our product catalogs feature circuit protection, power control and sensing products for OEM and aftermarket applications.

- Commercial Vehicle Aftermarket Catalog
- Automotive Passenger Car Catalog
- Automotive Fuse & Fuse Holder Selection Guide
