Subject: Storage Conditions and Shelf Life

Littelfuse circuit protection components, their manufacturing processes and their packaging are designed for very long life. There is no defined shelf life for our electrical products provided they have not been subjected to abnormal storage environments. In order to minimize the aging process, it is important that the components are stored in their original packaging in proper storage conditions. Littelfuse recommends storing products at $<35^{\circ}\text{C}$ and $<65\%$ relative humidity. Under typical storage conditions, the product performance does not deteriorate.
