DISCLAIMER

Specifications are subject to change without notice. Littelfuse Startco is not liable for contingent or consequential damages, or for expenses sustained as a result of incorrect application, incorrect adjustment, or a malfunction.
1. GENERAL

The SE-601 is a microprocessor-based ground-fault monitor for ungrounded dc systems. Its output relay can operate in the fail-safe or non-fail-safe mode for undervoltage or shunt-trip applications. The SE-601 has one output relay with isolated normally open and normally closed contacts for use in independent control circuits. Additional features include LED power and faulted-bus indication, autoreset or latching trips with front-panel and remote reset, trip memory, test button, self diagnostics, 0- to 5-V analog output, and digital selector switches. The SE-601 can be DIN-rail, surface, or panel mounted.

Ground-fault current is sensed using an SE-GRM-series Ground-Reference Module—a resistor network that limits ground-fault current to 25 mA. The trip level of the ground-fault circuit is selectable from 1 to 20 mA. Trip time is selectable from 0.05 to 2.5 s.

2. OPERATION

2.1 CONFIGURATION-SWITCH SETTINGS

See Fig. 1.

2.1.1 RELAY OPERATING MODE

Switch 1 is used to set the operating mode of the output relay. In the fail-safe mode, the output relay energizes when the SE-601 is energized and the ground-fault circuit is not tripped. If tripped, and the supply voltage is cycled, the SE-601 will remain tripped, with the trip relay de-energized and a TRIP LED on, until reset.

In the non-fail-safe mode, the output energizes when a ground-fault trip occurs. In the non-fail-safe mode, trip status is not retained in non-volatile memory.

2.1.2 RESET MODE

Switch 2 is used to select autoreset or latching trips. See Section 2.2.3.

2.2 FRONT-PANEL CONTROLS

2.2.1 GROUND-FAULT TRIP LEVEL

The LEVEL (mA) selector switch is used to set the ground-fault trip level.

Ground-fault current is a function of fault resistance, system voltage, and the SE-GRM-series Ground-Reference Module. Table 1 lists the SE-601 trip levels and fault-resistance values for 24-, 48-, 125-, 250-, 500-, 780-, and 1000-Vdc systems.

2.2.2 GROUND-FAULT TRIP TIME

The SE-601 has a definite-time trip characteristic. The TIME (s) selector switch is used to set the ground-fault trip time.

2.2.3 RESET

If the Reset Mode switch is in the LATCHING position, a trip remains latched until the RESET button is pressed or the remote-reset terminals (6 and 7) are momentarily connected. In the non-fail-safe mode, cycling the supply voltage will also reset the SE-601.

If the Reset Mode switch is in the AUTORESET position, a trip will reset when the fault is removed.

The reset circuit responds only to a momentary closure so that a jammed or shorted button will not prevent a trip. The front-panel RESET button is inoperative when remote-reset terminals are connected.

2.2.4 TEST

The TEST button is used to test the ground-fault circuit, trip indication, and the output relay. When the TEST button is pressed for one second, a test signal is applied to the ground-fault-detection circuit, the circuit will trip, both “-BUS” and “+BUS” TRIP LED’s will light, and the output relay will operate.

NOTES:

1. DIMENSIONS IN MILLIMETRES (INCHES).
2. MOUNTING SCREWS: M4 OR 8-32.
3. OVERALL DIMENSIONS WHEN MOUNTED ON DIN EN50022 35 mm x 7.5 mm TOP-HAT RAIL.
4. ADJUSTMENT KNOBS ARE REMOVABLE.
2.3 FRONT-PANEL INDICATION

2.3.1 POWER

The green LED labelled PWR indicates presence of the supply voltage.

2.3.2 TRIP

The red TRIP LED’s indicate a ground-fault trip. The “-BUS” TRIP LED indicates a ground fault on the negative dc bus. The “+BUS” TRIP LED indicates a ground fault on the positive dc bus. Two fast flashes indicate a diagnostic trip. See Section 2.5

2.4 ANALOG OUTPUT

The non-isolated, 0- to 5-V analog output indicates ground-fault current. The output is 5 V when ground-fault current is 20 mA. Use a PGA-0500 Analog Percent Current Meter with the PGA-05CV Voltage Converter to indicate ground-fault current. See Figs. 2 and 8.

2.5 SELF DIAGNOSTICS

A diagnostic trip is indicated by two fast flashes of the TRIP LED’s. It can be caused by a diagnostic problem detected by an incorrect reading from non-volatile memory. Press RESET or cycle supply voltage. If problems persist, contact Littelfuse Startco.

3. INSTALLATION

3.1 SE-601

An SE-601 can be surface or DIN-rail mounted. See Fig. 1. Panel mounting requires a PMA-55 or PMA-60 Panel-Mount Adapter. See Figs. 6 and 7.

Connect the SE-601 DC Ground-Fault Monitor and SE-GRM-series Ground-Reference Module as shown in Fig. 2.

Remove the connection to terminals 5 and 9 for dielectric-strength testing—all inputs and outputs have ANSI/IEEE C37.90 surge-protection circuits that conduct above 300 Vac.

3.2 GROUND-REFERENCE MODULES

Outline and mounting dimensions for the SE-GRM-series Ground-Reference Modules are provided in Figs. 3, 4, and 5.

The SE-GRM780 and SE-GRM1000 dissipate approximately 9.6 and 12.5 W respectively under normal conditions and 19.2 and 25.0 W respectively at maximum when a ground fault is present at 780 V or 1000 V. If the system is to be operated for more than two minutes with a ground fault present, an additional heat sink is required. This can be achieved by applying thermal compound (silicone grease) to the Ground-Reference Module’s mounting surface, then securely fastening it to an aluminum panel with minimum dimensions of 300 mm (12”) x 300 mm (12”) x 3 mm (0.120”)

INSTALLATION INSTRUCTIONS:
1. WITH COVER REMOVED LATCH MONITOR TO BRACKET.
2. INSERT BRACKET THROUGH FRONT OF PANEL CUTOUT AND SECURE WITH FLAT WASHERS AND LOCKNUTS PROVIDED.
3. CONNECT WIRING TO TERMINALS.
4. ATTACH COVER USING SECURITY SCREWS OR THUMB SCREWS PROVIDED.

NOTES:
1. DIMENSIONS IN MILLIMETRES (INCHES).
2. MEETS NEMA3, IP53.
3. INCLUDES TWO TR20 TAMPER-RESISTANT TORX SCREWS (M4-0.7x16 mm, INSTALLED) AND TWO THUMB SCREWS.
4. **SE-601 Compatibility**

The current SE-601 has been enhanced with the addition of non-volatile trip memory for the fail-safe relay operating mode. Prior to hardware revision 01, a mechanical flag was used instead of non-volatile memory. The current revision of the SE-601 can directly replace previous revision-00 units. The hardware-revision number is listed on the SE-601 model/serial-number label affixed to the SE-601 enclosure. Both generations are compared in Table 2.

and 20 mA

Trip-Time Settings .................. 0.05, 0.10, 0.20, 0.30,
0.40, 0.50, 1.0, 1.5, 2.0,
and 2.5 s

Accuracies: (1)

Trip Level .......................... 5% of setting,
0.15 mA minimum

Trip Time (2) ........................ 5% of setting,
15 ms minimum

Trip Mode ................................ Latching or Autoreset

Analog Output:

Range ................................ 0 to 5 V, 0.25 V per mA
Output Impedance .......... 220 Ω

Reset .................................. Front-Panel Button and
Remote, N.O. Momentary
Contact

Functional Test ....................... Front-Panel Button

Relay Contacts:

Configuration ................... Isolated N.O. and N.C.
Operating Mode .................. Fail-Safe or Non-Fail-
Safe

CSA/UL Rating .................. 8 A resistive, 250 Vac
8 A resistive, 30 Vdc
0.25 HP, 120/240 Vac

Supplemental Contact Ratings:

Carry Current .................. 8 A, maximum
Break:
30 Vdc .......................... 240 W Resistive,
170 W Inductive
(L/R = 7 ms)

120 Vdc ..................... 24 W Resistive,
17 W Inductive
(L/R = 7 ms)

ac ................................. 2,000 VA Resistive,
875 VA Inductive
(PF = 0.4)

(Subject to maximums of 8 A and 250 Vac/
30 Vdc or 200 mA at 120 Vdc)

Terminals ........................ Wire-clamping 24 to
12 AWG (0.2 to
2.5 mm²) conductors

Dimensions:

Height.............................. 75 mm (3.0")
Width............................. 55 mm (2.2")
Depth............................... 113 mm (4.5")

Shipping Weight .................... 0.45 kg (1 lb)

Environment:

Operating Temperature:
Altitude:
≤ 1,000 m (3,281') .......................... -40 to 60°C (-40 to 140°F)
3,000 m (9,843') ......................... -40 to 55°C (-40 to 131°F)
5,000 m (16,404') ...................... -40 to 50°C (-40 to 122°F)

Storage Temperature ............. -55 to 80°C (-67 to 160°F)
Humidity .......................... 85% Non-Condensing max
Altitude ........................ 5,000 m (16,404')

PWB Conformal Coating ......... MIL-1-46058 qualified
UL QMJU2 recognized

Surge Withstand .................. ANSI/IEEE 37.90.1-1989
(Oscillatory and Fast
Transient)

Vibration ......................... EN60255-21-1
(Vibration, Shock, and
Seismic)
EN60255-21-2 (Shock
and Bump)

EMC Tests:
Verification tested in accordance with EN 50263:2000
Radiated and Conducted
Emissions ......................... CISPR 11:2009,
CISPR 22:2008,
EN55022:2010
Class A

Current Harmonics and
Voltage Fluctuation ............ IEC 61000-3-2 and
IEC 61000-3-3
Class A
Electrostatic Discharge .......... IEC 61000-4-2
± 6 kV contact discharge
(direct and indirect)
± 8 kV air discharge

Radiated RF Immunity .......... IEC 61000-4-3
10 V/m, 80-1000 MHz,
80% AM (1 kHz)
10 V/m, 900 MHz,
200 Hz pulse modulated

Fast Transient ..................... IEC 61000-4-4
±4 kV on AC mains and
I/O lines

Surge Immunity .................... IEC 61000-4-5
Zone B
± 1 kV differential mode
± 2 kV common mode

Conducted RF Immunity .... IEC 61000-4-6
10 V, 0.15-80 MHz,
80% AM (1 kHz)

Magnetic Field Immunity ... IEC 61000-4-8
50 Hz and 60 Hz, 30 A/m
and 300 A/m

Voltage Interruption .......... IEC 61000-4-11,
IEC 61000-4-29,
0% for 5, 10, 20, 50,
100 & 200 ms 3x each

Power Frequency .............. IEC 61000-4-16
Zone A: differential
mode 150 Vrms
Zone A: common mode
300 Vrms

1 MHz Burst .................... IEC 61000-4-18
± 1 kV differential mode
(line-to-line)
± 2.5 kV common mode

RFI Compliance ................. FCC Part 15, Subpart B,
Class A – Unintentional Radiators

Certification ........................ CSA, Canada and USA

Complies to IEC 61010-1:2001 (2nd Edition);
EN 61010-1:2001 (2nd Edition) Safety Requirements
for Electrical Equipment for Measurement, Control, and
Laboratory Use – Part 1.

NOTES:
(1) Over operating temperature range of -40 to 60°C (-40
to 140°F).
(2) Trip time at 3 × trip-level setting.

5.2 GROUND REFERENCE MODULES
Nominal Current .................. 12.5 mA

Maximum Fault Current ........... 25 mA

Duty Cycle .......................... Continuous

Environment:
Operating Temperature .......... -40 to 60°C (-40
to 140°F)
Storage Temperature .......... -55 to 80°C (-67 to
160°F)
Humidity ......................... 85% Non-Condensing

SE-GRM024:
Power Dissipation
At 24 Vdc ....................... Unfaulted 0.3 W,
Ground Fault 0.6 W maximum

Shipping Weight .............. 300 g (0.7 lb)

SE-GRM048:
Power Dissipation
At 48 Vdc ....................... Unfaulted 0.6 W,
Ground Fault 1.2 W maximum

Shipping Weight .............. 300 g (0.7 lb)

Consult factory for other ground-reference modules.
7. WARRANTY

The SE-601 DC Ground-Fault Monitor is warranted to be free from defects in material and workmanship for a period of five years from the date of purchase.

Littelfuse Startco will (at Littelfuse Startco’s option) repair, replace, or refund the original purchase price of an SE-601 that is determined by Littelfuse Startco to be defective if it is returned to the factory, freight prepaid, within the warranty period. This warranty does not apply to repairs required as a result of misuse, negligence, an accident, improper installation, tampering, or insufficient care. Littelfuse Startco does not warrant products repaired or modified by non-Littelfuse Startco personnel.

8. GROUND-FAULT PERFORMANCE TEST

A test record form is provided for recording the date and the final results of the performance tests. The following ground-fault system test is to be conducted by qualified personnel.

a) Evaluate the interconnected system in accordance with the overall equipment manufacturer’s detailed instructions.

b) Verify proper reaction of the device in response to a simulated or complete system test.

c) To simulate a ground fault, power down the entire system and remove the connection to terminal 4 (S). Ensure that terminal 5 is connected to ground. Using a 24 Vdc source, 50 kΩ variable resistor, fixed 1 kΩ resistor, and an ammeter, connect the circuit as shown in Fig. 9. Select a trip current on the SE-601, and slowly vary the resistance until the monitor trips. Never exceed 30 mA through the monitor.

d) For a system ground-fault test, install a fixed or variable resistance and switch that is suitably rated for the system. Install a fuse rated to protect the test circuit. The fixed test resistance can be sized to cause a ground-fault current just above the trip level setting. See Fig. 10. For a reference of fault-resistance values, see Table 1.

e) Record the date and the results of the test on the attached test record form.

![FIGURE 9. Ground-Fault Test Circuit.](image-url)
