We Improve Electrical Safety and Increase Productivity

The Industrial Business Unit of Littelfuse delivers vital products to address customer needs for protection, safe control and distribution of electrical power in industrial applications. Our electrical safety product portfolio includes a comprehensive line of fuses, fuse holders, protection relays, and custom-engineered electrical products to minimize electrical safety hazards, limit equipment damage, improve productivity, and safeguard personnel from injury due to electrical faults.

Technically speaking, professionals in construction, manufacturing, mining, oil & gas, solar, and many more industries rely on Littelfuse for rugged, lasting protection for their designs.

Safety
- Shock Hazard
- Injury to Personnel
- Arc-Flash Hazards
- Open-CT Hazards
- Failed Resistors

Cost

Submersible Pumps – Optimized Protection
111-INSIDER-P / 231-INSIDER-P

Single-Phase Pump Monitor
for use with the Pentek®, Franklin®, CentriPro®, Grundfos®, Flowise Pro®, or Flint and Walling® Control Box

Description
The Littelfuse 111-Insider-P single-phase products fit inside ½ and ½ hp, 115 V control boxes and the 231-Insider-P fits inside ⅓, ½, ¾, and 1 hp, 230 V control boxes. Both models are designed to protect single-phase pumps from dry-well, dead-head, jammed impeller, rapid-cycle, overvoltage, and undervoltage conditions.

A calibration adjustment allows the Insider to be calibrated to your specific pumping applications, thereby reducing the possibility of false or nuisance tripping. A unique microcontroller-based voltage and current-sensing circuit constantly monitors the incoming power for fluctuations, overcurrent, and undervoltage. When an abnormality, such as loss of suction is detected, the product deactivates its output relay and directly disconnects the pump motor. The unit then begins its user-selectable restart delay (dry-well recovery) timer. When the timer counts to zero or power is removed and reapplied, the unit reactivates its output relay and turns the pump back on. By leaving the restart delay knob in the reset position, the unit will operate in manual reset mode.

The Insider communicates with a hand-held diagnostics tool called the Informer (sold separately). The Informer displays parameters including calibration points, trip points, run time and last faults. An IR Kit-12 (12” fiber optic kit) is included with each Insider, allowing the Informer to access these parameters even when the Insider is enclosed in a control box. This is valuable for troubleshooting the pump while it is running.

Note: The 111/231-Insider-P models have a sensitivity adjustment for the dry-well trip point. After calibration is done, you can adjust the sensitivity for the dry-well/dead-head trip point from 70-90% of the full load. This makes the unit even more adaptable to varying pumping applications. If you have a very low producing well, you increase the sensitivity closer to the 90% mark, or if you have a very heavy producing well, you would decrease the sensitivity around the 70% mark.

Submersible Pumps – Optimized Protection
111P / 233P / 233P-1.5

Single-Phase Pump Monitor

Description
The Littelfuse Models 111P (115 V, ¼ to 1 hp); 233P-1.5 (230 V, ¼ to 1.5 hp); and 233P (230 V, ¼ to 3 hp) protect pumps from dry-well, dead-head, jammed impeller, overvoltage/undervoltage conditions, and rapid-cycle protection whether the pressure switch is mounted before or after our unit.

A calibration adjustment allows the unit to be calibrated to your specific pumping applications, thereby reducing the possibility of false or nuisance tripping. A unique microcontroller-based voltage and current-sensing circuit constantly monitors the incoming power for fluctuations, overcurrent, and undercurrent. When an abnormality, such as loss of suction is detected, the unit deactivates its output relay and directly disconnects the pump motor. The unit then begins its user-selectable restart delay (dry-well recovery) timer. When the timer counts to zero or power is removed and reapplied, the unit reactivates its output relay and turns the pump back on.

The infrared LED communicates with a hand-held diagnostics tool called the Informer (sold separately). The Informer displays parameters including calibration points, trip points, run time and last faults.

Special considerations for pump cables larger than #10 AWG:
In some cases where larger motors are installed with deep set pumps, pump cables are used that exceed the relay’s terminal size. In these conditions, a short splice of #10 AWG or #12 AWG may be a solution at the control box.

Note: All local, state and national electric codes should be followed when applying this solution.

NOTE: The 111P/233P/233P-1.5 models have a sensitivity adjustment for the dry-well trip point. After calibration is done, you can adjust the sensitivity for the dry-well/dead-head trip point from 70-90 % of the full load. This makes the unit even more adaptable to varying pumping applications. If you have a very low producing well, you increase the sensitivity closer to the 90 % mark, or if you have a very heavy producing well, you would decrease the sensitivity around the 70 % mark.

Accessories
Informer

235P

Single-Phase Pump Monitor

Description
The Littelfuse 235P is designed to protect 5-15 hp, 230 V, single-phase pumps from dry-well, dead-head, rapid-cycle, jammed impeller, and overvoltage and undervoltage conditions.

A calibration adjustment allows the 235P to be calibrated to your specific pumping applications, thereby reducing the possibility of false or nuisance tripping. A unique microcontroller-based voltage and current-sensing circuit constantly monitors the incoming power for fluctuations causing overcurrent and undervoltage. When an abnormality, such as loss of suction is detected, the 235P deactivates its output relay and directly disconnects the pump motor. The unit then begins its user-selectable restart delay (dry-well recovery) timer. When the timer counts to zero or power is removed and reapplied, the unit reactivates its output relay and turns the pump back on.

The 235P communicates with a hand-held diagnostics tool called the Informer (sold separately). The Informer displays parameters including calibration points, trip points, run time and last faults.

An external current transformer is required for operation (sold separately).

Special considerations for pump cables larger than #10 AWG: In some cases where larger motors are installed with deep set pumps, pump cables are used that exceed the relay’s terminal size. In these conditions, a short splice of #10 AWG or #12 AWG may be a solution at the control box.

Note: All local, state and national electric codes should be followed when applying this solution.

NOTE: The 235P model has a sensitivity adjustment for the dry-well trip point. After calibration is done, you can adjust the sensitivity for the dry-well/dead-head trip point from 70-90 % of the full load. This makes unit even more adaptable for varying pumping applications. If you have a very low producing well, you increase the sensitivity closer to the 90 % mark, or if you have a very heavy producing well, you would decrease the sensitivity around the 70 % mark.

TYPICAL WIRING DIAGRAM FOR 235P

*Note: 50 Hz will increase all delay timers by 20%
Submersible Pumps – Optimized Protection

ABBREVIATED INSTALLATION INSTRUCTIONS

Mounting (111P/233P/235P only)
Use in conjunction with UL listed or recognized thermal or solid-state overload relays only.
1. Mount the Model 111P/233P/235P in a convenient location in or near the pump control box. If the location is wet or dusty, a NEMA 3R, 4 or 12 enclosure should be used.

Calibration/Restart Delay
Note: All models should be calibrated during normal pumping conditions. There must be a “call for water”; ensure the pressure or float switch is fully closed.

INSIDER Models
1. Turn the RESTART DELAY/CALIBRATION knob fully counter-clockwise to the CAL position and close the control box cover.
2. Apply power to the system. The pump should run for approximately 10 seconds and then shut off—this indicates the INSIDER has calibrated.
3. Remove power from the system. Open the control box and set the appropriate dry-well recovery time with the RESTART DELAY/CALIBRATION knob.
4. Shut the control box and re-apply power to the system.

111P/233P/235P Models
1. Turn the RESTART DELAY/CALIBRATION knob fully counter-clockwise to the CAL position.
2. Apply power. The pump will run for approximately 10 seconds then shut off.
3. Set the RESTART DELAY/CALIBRATION knob to the desired restart delay (dry-well recovery time). The pump will turn on.

Note: If the Model 235P immediately trips out upon completion of the calibration process, the current transformer may be installed incorrectly. Switch the CT1 and CT2 connections at the unit, then repeat the calibration process.

Calibrating While Pumping
The 111P/233P/235P can also be calibrated while the pump is running. Turn the RESTART DELAY/CALIBRATION knob to CAL while pumping. Wait for the pump to turn off (approximately 10 seconds), then adjust the RESTART DELAY/CALIBRATION knob to the desired restart delay setting.

Manual Reset Mode (111P/233P/235P only)
Set the RESTART DELAY/CALIBRATION knob to RESET for manual reset mode. If the 111P/233P/235P trips off due to a voltage or load problem, the RESTART DELAY/CALIBRATION knob must be rotated out of the RESET position to restart the pump, and then can be placed back in the RESET position for subsequent manual reset mode.

Note: Any restart delay can be bypassed by rotating the RESTART DELAY/CALIBRATION knob to the RESET position and back to the desired restart delay setting.

Note: The restart delay can be changed at any time. The next trip will follow the new restart delay setting.

Operation
The Littelfuse Pump Protection units monitor pump loads in amperes and kilowatts. When the current (amperes) exceeds approximately 125 % of calibrated current, or power (kW) drops below the adjustable underload trip point, the units—after the trip delay—will turn off the pump. The units will automatically restart the pump after the selected restart delay time (unless in the manual reset mode).

The calibration is stored in permanent memory. The units do not need to be re-calibrated if power is lost.

Sensitivity
The Littelfuse Pump Protection units have an adjustment knob to set the underload trip sensitivity. Setting SENSITIVITY to the middle position (straight up) is equivalent to Littelfuse’s standard underload trip level. Adjust the SENSITIVITY knob to increase/decrease underload sensitivity up to approximately ±10 % of the standard trip. It may be necessary to increase the sensitivity if the unit does not trip on dry-run or dead-head or it is known that the water level in the well is very low relative to the pump’s capabilities.

WARNING: Decreasing the SENSITIVITY may compromise the unit’s ability to detect dry-run and/or dead-head conditions.

Run Hours
The Littelfuse Pump Protection units record pump run hours. Run hours can be displayed by a Littelfuse Informer. Run hours can be reset on the units. Please read the instructions fully before performing the procedure.

Note: Turn the SENSITIVITY knob completely to the left (counter-clockwise) or completely to the right (clockwise) when directed.

WARNING: Ensure power is applied to the INSIDER models in a safe manner when performing the following procedure.

To Reset Run Hours:
1. Remove power to the units.
2. Set the RESTART DELAY/CALIBRATION knob to RESET and the SENSITIVITY knob to the middle (12:00) position.
3. Apply power to the unit—the CAL LIGHT will turn on.
4. Turn the SENSITIVITY knob to the right—the CAL LIGHT will turn off and the RUN LIGHT will turn on.
5. Turn the SENSITIVITY knob to the left—both lights will turn on.
6. Turn the SENSITIVITY knob to the right.
7. After 10 seconds, the CAL and RUN LIGHTS will blink twice indicating the run hours have successfully been reset.
Rapid Cycling
Rapid cycling is defined as more than 4 restarts in a 60-second period. The units are capable of detecting a rapid-cycle condition whether a control device, such as a pressure switch, is installed before or after it. Upon detecting either form of rapid cycling, the unit will lock-out, preventing damage to the pump. To reset the unit, remove and re-apply power.

Rapid Cycling (Line Side/Upstream)
Rapid cycling of the line side of the units may be caused by several naturally occurring conditions which are indistinguishable from true rapid cycling. For this reason, once tripped, the units will wait 30 minutes and restart for protection. If any restart is successful (pump runs for more than 1 minute), the rapid cycle counter will reset to zero. If the unit encounters rapid cycle 4 times without a successful restart, the unit will lock-out and require a manual reset. To reset, remove and re-apply power.

Note: Turn the SENSITIVITY knob completely to the left (counter-clockwise) or completely to the right (clockwise) when directed.

To Enable Line-Side Rapid-Cycle Protection:
(to disable, follow the same procedure and replace the jumper on the unit) (Insider models only)
1. Locate the Rapid-Cycle Jumper in the upper-right corner behind the faceplate of the unit.
2. Remove the Rapid-Cycle Jumper. The jumper may be removed before or after initial installation.
3. Save the removed jumper.
4. If the unit is not already installed, install as described in the CONNECTIONS section of the unit’s install manual.
5. Re-apply power.

To Enable Rapid-Cycle Protection when a Control Device is Installed BEFORE the unit: (to disable, follow the same procedure)
1. Remove power to the unit.
2. Set the RESTART DELAY/CALIBRATION knob to RESET and the SENSITIVITY knob to the middle (12:00) position.
3. Apply power to the unit—the CAL LIGHT will turn on.
4. Turn the SENSITIVITY knob to the right—the CAL LIGHT will turn off, RUN LIGHT will turn on.
5. Turn the SENSITIVITY knob to the left—both lights will turn on.
6. Turn the SENSITIVITY knob right—left—right—left—right, in a quick and smooth manner.
7. After 2 seconds, the CAL and RUN LIGHTS will blink once indicating line side rapid-cycle protection has been enabled.

Rapid Cycling (Load Side/Downstream)
Load side rapid cycling of the pump will immediately result in a manual lock-out. The pump will not restart automatically. To reset, remove and re-apply power.

Note: Protection against rapid cycling of a control device installed after the unit is always enabled. Disabling line side detection will not disable load side detection.
Submersible Pumps – Optimized Protection
111P-ENCL / 233P-ENCL / 233P-1.5-ENCL / 235P-ENCL

Single-Phase Pump Monitor in NEMA Box

Description
The ENCL enclosure is a metal electrical box that meets the National Electrical Manufacturers Association’s and Underwriter Laboratory’s standard for a 3R rating. The ENCL box can house one of several single-phase Littelfuse Pump Protection products. It has three clear lenses on the cover for viewing the LEDs on the units, allowing the customer to determine the units operational status and to provide access to the IR signal for use with the Informer diagnostic tool.

The ENCL enclosure is sold ONLY in conjunction with the single-phase 111P, 233P, 233P-1.5, and 235P models.

Special considerations for pump cables larger than #10 AWG: In some cases where larger motors are installed with deep set pumps, pump cables are used that exceed the unit’s terminal size. In these conditions, a short splice of #10 AWG or #12 AWG may be a solution at the control box. Note: All local, state and national electric codes should be followed when applying this solution.

An external current transformer is required for operation of the Model 235P (sold separately).

Specifications (Enclosure)

Classification
NEMA 3R

Grounding
Two separate ground tabs

General Characteristics

Dimensions (with cover on)
H 210.82 mm (8.3”);
W 139.70 mm (5.5”);

Bluetooth® Overload Relay

Description
The MP8000 is an advanced motor protection electronic overload relay, fully programmable via Bluetooth® using an iPhone® or Android® smartphone or tablet with the Littelfuse App. It is easy to use and arc-flash safety is increased because the app allows settings to be modified and real-time operational information viewed. Viewing operational information and faults on the app does not require the user to open the control panel.

The MP8000 protects any motor drawing 0.5-1,000 full load amperes (external CTs are required above 100 A). It is designed for single or 3-phase systems with operating voltages of 90-690 V ac (use of external potential transformers can extend upper voltage range above 690 V ac). The unit requires 85-264 V ac control power, so applications on 480-600 V ac systems must have a control power transformer in the panel to step the voltage down to a lower control voltage. Common applications include protecting motors on pumps for water, wastewater, oil and chemicals, as well as motors running fans, compressors, and other industrial equipment.

Protection is unsurpassed by combining overload, voltage, phase loss and reversal, voltage and current unbalance, power monitoring, and underload in one package. For standalone applications, the Bluetooth® interface can be used when paired with a smartphone or tablet. The units also feature an Ethernet communications port that can be used to form an Ethernet Modbus TCP/IP or Ethernet/IP network. Units can be remotely monitored and controlled from a PC, or SCADA system, and data logging through a PC with the optional MP8000 software or other software program using the MP8000 memory map. This capability allows for a simple cost-effective way to further enhance arc-flash safety.

Advanced Features
- Overload (Overpower) (49)
- Underload (Underpower) (37P)
- Overcurrent (51)/Jam
- Undercurrent (37)
- Current Unbalance/Phase Loss (46)
- Phase Reversal (47)
- Overvoltage (59)
- Undervoltage (27)
- Voltage Unbalance (47)
- Rapid Cycling/Jog
- Contactor Failure
- Zero-Sequence Ground Fault (50Ns)
- PTC Motor Overtemperature (49)

Single-Phase Pump Protection
77C-KW/HP / 77C-LR-KW/HP

Programmable and Low-Range Programmable Power Monitor/Overload Relay

Description
The 77C-KW/HP is a programmable solid-state power monitor/overload relay that protects single-phase, 100-240 V ac, 2-800 A pumps (external CTs are required for 91-800 A) from dry-well, dead-head, jammed impeller and other voltage and current conditions. The LR version is designed for easier installation at a lower 1-9 full load amperes.

This Littelfuse 77C-KW/HP is programmable to your specific pumping application and provides a digital display of real-time data of the pump’s operation and fault conditions. The programmability allows the user to set trip points, trip delays and restart delays, to include protection from successive power outages and short-cycling/rapid-cycling caused by other motor controls, and delays for motor cool-down time and dry-well recovery time.

The 77C-KW/HP can be programmed and monitored through network communications, as well as hooked to a remote display unit to program and monitor the pump protection from an alternate location, or outside the electrical panel to avoid potential arc flash (arc flash is a serious hazard that can happen when opening an electrical panel).

Programming

1. Rotate the MODE SELECT switch to the parameter to be programmed. It is recommended that PWS be programmed first on the KW/HP versions.
2. Press and hold the RESET/PROGRAM button.
3. While holding the RESET/PROGRAM button, rotate the DISPLAY/PROGRAM knob until the proper setting for the parameter that is being programmed is displayed.
4. Release the RESET/PROGRAM button. This stores the new parameter in the nonvolatile memory. If the number changes back to what it was before programming, then the tamper guard is on and will need to be unlocked before programming can be completed.
5. Continue steps 1-4 until all parameters are programmed.
Suggested Settings

(Consult the Motor Manufacturer for their recommendations.)

LV/HV - The recommended settings for LV (low voltage) and HV (high voltage) depend on many factors such as motor usage, motor size, environmental factors and tolerance of the motor. The motor manufacturer should be consulted for HV and LV settings. However, the NEMA MG1 standard recommends that LV and HV be set to no more than ±10 % of the motor’s nameplate voltage. The setting can be determined by multiplying the motor’s nameplate voltage by the recommended percent over and under voltage. (e.g., The motor nameplate voltage is 230 V, set LV to 0.9 x 230 = 207, set HV to 1.1 x 230 = 253) LV can not be set higher than HV, so HV may have to be adjusted higher before the proper LV setting can be programmed.

MULT - The multiplication factor for determining true current settings and represents the number of conductors passing through the main current window marked B, or current transformer ratio of external CTs. The appropriate number can be determined from Table 1 (Table 2 for -LR version) on page 18. MULT must be correctly programmed in order to accurately program the current settings.

OC - Represents the motor’s maximum service factor amperage. The OC (overcurrent) setting depends on many factors such as motor usage, motor size, environmental factors and tolerance of the motor. The motor manufacturer should be consulted for OC settings. However, OC is typically between 110 % and 125 % of full load amperage (FLA) and may be referred to as maximum amperes or service factor amperes.

LP - (Low power setting) is used to shut down the motor or pump on an underload condition. Setting LP to 0 disables the underload trip feature. LP is set in either kilowatts (kW) or horsepower (hp) depending on the PWS setting.

NOTE: PWS must be set before setting LP

TC - Designates the trip class for overload protection. The trip class defines the trip delay when an overload is detected. Trip class is determined by the type of motor and application. Your motor manufacturer should be consulted for the proper setting. Table 4 shows the trip class and a general description of the applications and Table 5 shows the trip class curves.

RD1 - is the rapid-cycle timer. It will engage when the motor is first powered-up or after the motor controls shut down the motor. An RD1 setting of 20-30 seconds will generally protect the motor from rapid, successive power outages or short cycling caused by the motor controls. A setting of 0 seconds will allow the motor to start immediately after power-up or after a normal shutdown.

RD2 - is the restart delay after the overload relay trips on overcurrent. This delay allows the motor to cool down after experiencing an overcurrent. It is also known as a motor cool down timer. Your motor manufacturer should be contacted to determine this setting. Under normal circumstances, a setting of 5-10 minutes will give the motor enough time to cool down between faults.

RD3 - is the restart delay after an underload. It is also known as a dry well recovery timer and is usually used in submersible pumping applications. The setting of RD3 depends on the recovery time of the water well and varies widely from application to application.

#RU - is the number of successive restart attempts allowed after an underload fault, before the overload relay requires manual reset. The following settings are available: 0, 1, 2, 3, 4 and A. A setting of “0” is manual reset and a setting of A is continuously automatic reset.

ADDR - is the address setting for RS485 communications. Available settings are from A01- A99. You may ignore this setting if RS485 communications are not used.

PWS - (power scale) is the range setting for the LP setting.

<table>
<thead>

<tr>
<td>8 = 134 - 871 hp</td>
<td></td>
</tr>
</tbody>
</table>

Settings 1-4 will allow the LP setting to display in KW. Settings 5-8 will allow the LP setting to display in hp.

OPT1 - Linear overcurrent trip delay (2-60 seconds). This programming position is used only if the TC position is set to LIn. This setting will determine the period of time that will expire before tripping on overcurrent, after the amperage exceeds the OC setting.

OPT2 - RD2 & RD3 time units programming. This position sets the time units used by the RD2 and RD3 timers. (e.g., RD2 = 10, RD3 = 20; OPT2 = 2 from Table 3 below, RD2 = 10 seconds and RD3 = 20 minutes.)

Table 5: Overload Trip Curves

Multi-Function System Display
The output display shows various system operating parameters (L1-L2 Voltage, L2 Current (B), kilowatts, and horsepower).

When MODE SELECT is in the RUN position, the LED will display one of the above operating parameters.
To select or change the displayed parameter, turn the DISPLAY/PROGRAM knob to the desired position as shown on its label.

The multifunction display is used for programming purposes and also announces system faults such as low voltage and high voltage. Any time MODE SELECT is in the RUN position, the RESET/PROGRAM button may be pushed to view the last fault which occurred. Table 6 below shows the possible messages.

Table 6: Output Displays

Three-Phase Pump Protection
777-P2 SERIES

Fully Programmable Electronic Overload Relay

Description
The 777-P2 Series is a family of fully programmable electronic overload relays. They are designed to monitor and protect any 3-phase 200-480 V ac motor drawing 2-800 full load amperes (external CTs are required above 90 A). They provide unsurpassed protection from faulty voltage, underload and overload conditions. The 777-P2 can be used in a variety of 3-phase applications and features an undercurrent trip point (adjustable on the unit) that is favorable anytime there is a notable difference between a load and no-load condition. The overload relay displays voltage and current on the face of the unit. The LR version is designed for easier installation at a lower range of 1-9 full load amperes. The HVR version is designed with a high voltage relay for control circuits operating at 480 V ac.

The 777-P2 Series units incorporate a 3-digit LED display that is used for programming, providing real-time operational information, and displaying diagnostic codes to aid in troubleshooting a fault condition.

The unit’s many features include enhanced trip classes beyond the NEMA standard trip classes. The settable trip class range is 2-60, with or without jam protection, and a secondary linear trip delay can be set with a range of 0-60 seconds. If both trip class and linear trip delay are set, the 777-P2 will follow the faster trip time. Another feature is the automatic dry-well recovery timer that allows the unit to automatically select a restart delay based on the last cycle’s run time. This allows the 777-P2 to optimize restart delay times.

Network communications: compatible with Modbus, DeviceNet™, Profinet, or Ethernet using optional communications module.

Three-Phase Pump Protection

777-KW/HP-P2 SERIES

Fully Programmable Electronic Power Monitors

Description

The Model 777-KW/HP-P2 Series is a family of fully programmable electronic power monitors. They are designed to monitor and protect any 3-phase 200-480 V ac motor drawing 2-800 full load amperes (external CTs are required above 90 A). They provide unsurpassed protection from faulty voltage, underload and overload conditions. The 777-KW/HP-P2 can be used in a variety of 3-phase applications and features a low power trip point (adjustable on the unit) that is desirable any time the current vs. load characteristic is non-linear or has little change. In general, this applies to small slow speed motors, small centrifugal motors and fractional horsepower motors. Low power protection can be used any time in place of undercurrent protection. The power monitor displays voltage, current, kilowatts and horsepower on the face of the unit. The LR version is designed for easier installation at a lower range of 1-9 full load amperes. The HVR version is designed with a high voltage relay for control circuits operating at 480 V ac.

The 777-KW/HP-P2 Series units incorporate a 3-digit LED display that is used for programming, providing real-time operational information, and displaying diagnostic codes to aid in troubleshooting a fault condition.

The unit’s many features include enhanced trip classes beyond the NEMA standard trip classes. The settable trip class range is 2-60, with or without jam protection, and a secondary linear trip delay can be set with a range of 0-60 seconds. If both trip class and linear trip delay are set, the 777-KW-HP-P2 will follow the faster trip time. Another feature is the automatic dry-well recovery timer that allows the unit to automatically select a restart delay based on the last cycle’s run time. This allows the 777-KW/HP-P2 to optimize restart delay times.

Network communications: compatible with Modbus, DeviceNet™, Profinet, or Ethernet using optional communications module.

Specifications

Functional Specifications

Programmable Operating Points (on face of the units)

- LV-Low Voltage Threshold: 170-524 V
- HV-High Voltage Threshold: 172-528 V
- VUB-Voltage Unbalance Threshold: 2-25 % or 999 (disable)
- MULT-# of Conductors or CT Ratio (xxx:5)

- OC-Overcurrent Threshold: 1-10, 100, 150, 200, 300, 400, 500, 600, 700, 800

- PWS-Power Scale: (20-100 A) ÷ MULT or 80-140 % of CT Primary

Programming
To program prior to installation, connect the 9-V battery cable to the pins on the left side of the unit (when looking at the display), and then attach a standard 9-V battery to the cable. The 9-V battery cable is keyed for proper installation. If the cable is connected improperly, the unit will not power its display. DO NOT connect the battery when line voltage is present. The unit cannot be tested for proper operation or communications using a 9-V battery. For testing purposes, 3-phase power must be used with a minimum voltage of 200 V ac. Follow all safety warnings when dealing with hazardous voltages.

1. Rotate the MODE SELECT switch to the parameter to be programmed. It is recommended that PWS be programmed first on the KW/HP versions.

2. Press and hold the RESET/PROGRAM button.

3. While holding the RESET/PROGRAM button, rotate the DISPLAY/PROGRAM knob until the proper setting for the parameter that is being programmed is displayed.

4. Release the RESET/PROGRAM button. This stores the new parameter in the nonvolatile memory. If the number changes back to what is was before programming, then the tamper guard is on and will need to be unlocked before programming can be completed. (See Tamper Guard section in the install manual if necessary.)

5. Continue steps 1-4 until all parameters are programmed.

Programmable Parameters
The following settings MUST be programmed by the user in order to provide proper protection for the application. Settings vary by situation and application and should be selected and tested for each unique installation. All parameters are actual values except for the VUB and CUB settings; these are programmed as percentages. The range each parameter can be programmed is found in the electrical specifications table. Failure to program all setpoints could result in nuisance tripping or prevent the device from protecting the motor. Always use the proper CTs for the motor full-load amperage (FLA).

LV/HV - Low Voltage/High Voltage. The recommended settings for LV (low voltage) and HV (high voltage) according to the NEMA MG1 standard are ±10 % of the motor’s nameplate voltage. Generally, the motor manufacturer should be contacted to verify these limits. High and low voltage trips are based on average voltage measured. Never set LV higher than HV.

Example: Nameplate voltage = 230 V
LV = 90 % x 230 = 207 V
HV = 110 % x 230 = 253 V

VUB - Voltage Unbalance. The NEMA MG1 standard says a motor should not be operated above a 1 % voltage unbalance without derating the motor. Most utility supplied power sources have a difficult time sustaining a 1 % VUB. The motor manufacturer should be consulted for an exact VUB setting. Setting VUB to 999 will disable voltage unbalance protection, but will not disable voltage single-phase protection. Voltage unbalance is calculated as follows:

% Voltage Unbalance = [(Maximum deviation from the average)/Average] x 100 %

Example: Measured line-line voltages = 203, 210, and 212. The average = (203+210+212)/3 = 208.3. The maximum deviation from the average is the greatest difference between the average voltage (208.3) and any one voltage reading: 212-208.3 = 3.7, 210-208.3 = 1.7 and 208.3-203 = 5.3. The maximum deviation from the average is 5.3, thus voltage unbalance = 5.3/208.3 x 100 = 2.5 %.

MULT - (multiplier) setting is found in Table 8 (Table 9 for -LR version, Table 10 for -MLR version). The MULT setting is determined by the number of passes of the motor leads or the size of external CTs and the full-load amperes of the motor the unit will be monitoring. MULT sets the trip point range for overcurrent and ground fault current faults. Set MULT first, then set OC and GF.

OC - Overcurrent. Is typically set to the service-factor amperage (SFA) of the motor or 100-135 % of motor full-load amperes (FLA), which are determined by the motor manufacturer. If any one leg exceeds the OC setting, the unit will trip according to the Trip Class (TC) settings.

NOTE: When using external CTs, do not set OC greater than the thermal rating of the CTs

UC - Undercurrent (for non-KW/HP versions). Is most commonly set to 80 % of the full-load amperage (FLA) of the motor. This is usually adequate for protection of loss of load for many pumps and motors, including submersibles. If the motor is drawing less than full-load amperage, then the UC may be set lower than 80 % of FLA for adequate protection. Centrifugal/booster pumps may have to be set to something higher than 80 % of FLA for adequate protection. UC can be set to 0 if UC protection is not desired. The unit examines average current to determine if an undercurrent trip condition exists. The value must be lower than OC.
Three-Phase Pump Protection
777-P2 / 777-KW/HP-P2 SERIES INSTALLATION INSTRUCTIONS

LP - Low Power (for KW/HP versions) setting is used to shut down the motor or pump on an underload condition (that is based on power instead of solely on current). LP can be set in either kilowatts (kW) or horsepower (hp) as determined by the PWS setting. Setting LP to 0 disables the underload trip feature.

NOTE: PWS must be set before setting LP.

CUB - Current Unbalance. Littelfuse recommends contacting the motor manufacturer for a specific setting. Current unbalance is calculated the same way voltage unbalance is calculated (see formula under VUB). Setting CUB to 999 will disable current unbalance and current single-phase protection.

TC - Trip Class. Determines how quickly the unit will trip when an overcurrent (overload) condition is detected. TC is a dual-function setting—both a thermal trip class (NEMA standard) and a linear trip delay (in seconds) can be set.

While the standard trip classes are 5, 10, 15, 20, and 30, TC can be set from 2–60, with or without jam protection. The trip class setpoint is the time in seconds that the device will take to trip when any phase current is greater than or equal to 600 % of the OC setpoint. These additional “non-standard” trip classes allow the unit to follow a trip curve in-between the “standard” trip class curves shown in Table 11.

Trip classes 2–60 can be set from approximately the 7 o’clock to 10 o’clock position with the DISPLAY/PROGRAM knob. Trip classes J02–J60, which include jam protection, can be set from approximately the 10 o’clock to 1 o’clock position. This additional jam protection feature, when enabled, is initiated 1 minute after the motor starts and provides a 2-second trip delay for motors exceeding 400 % of the OC setpoint.

The linear overcurrent trip delay can be set from approximately the 1 o’clock to 5 o’clock position from 0–60 seconds (L00–L60) or to “oFF.” If TC is set to L00, the unit will trip off within 1 second after motor current reaches the OC setpoint. If both trip class and linear trip delay settings are programmed, the unit will follow the faster trip time. For example, TC is set to J15 and L20, and the amperage is 200 % of the OC setting. Following the trip class 15 curve, the unit will trip off in approximately 100 seconds. Thus the unit will follow the linear trip delay setting, because it is faster, and will trip off in 20 seconds.

The motor manufacturer should be contacted for an exact TC setting. Table 11 describes the trip classes, and Table 5 (page 20) shows the trip class curves.

Table 11: Trip Classes

<table>
<thead>
<tr>
<th>TRIP CLASS</th>
<th>APPLICATION DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>Small fractional horsepower motors where acceleration times are almost instantaneous or where extremely quick trip times are required.</td>

<td>(Slow Trip) Motors with long acceleration times (&gt;10 seconds) or high inertia loads.</td>
</tr>
<tr>
<td>J Prefix</td>
<td>Programming any of the trip classes with the J Prefix will enable jam protection. This additional protection is enabled 1 minute after the motor starts and provides a 2-second trip time for motors exceeding 400 % of the OC setting, regardless of trip class.</td>
</tr>
<tr>
<td>Non-Standard Trip Classes</td>
<td>Trip time in seconds when any phase current is 600 % of OC. Time is approximately 90 % of the TC setting</td>
</tr>
</tbody>
</table>

RD1 - Restart Delay One. Rapid-cycle timer, in seconds (default). The purpose of this timer is to provide protection against short cycling and to allow adequate cool-down time between motor starts. This timer is initiated when power is first applied to the unit. If no voltage fault conditions exists, the output relay will energize (the NO will close and the NC will open) as soon as RD1 timer expires. In most cases, this is set to 20-30 seconds. This should provide adequate protection for successive power outages or short cycling caused by other motor controls. This timer is also initiated when motor current goes to zero. Setting RD1 to zero will turn off this feature and ensure that when an alarm circuit is used, an alarm will sound only when there is a fault or power to the unit is lost.

RD2 - Restart Delay Two. Referred to as a motor cool-down timer, in minutes (default). RD2 is used to restart the motor after a trip due to a current unbalance, current single-phasing, or an overcurrent condition. A setting of 5–10 minutes will give most motors adequate time to cool down after an overcurrent condition. The motor manufacturer should be contacted for an exact value.

RD3 - Restart Delay Three. This timer, in minutes (default), only initiates after an undercurrent/low power trip and is referred to as a dry-well recovery timer in pumping applications. This is set according to the time it takes for the well to recharge after pumping dry. This setting varies widely by application and there is no typical setting. RD3 can be set from 2-500 minutes or to A to enable the automatic Dry-Well Recovery Calculator. The Automatic Dry-Well Recovery Calculator.
Calculator allows the unit to automatically select a restart delay based on the run time of the last run cycle before tripping on an undercurrent/low power fault. Table 12 shows the next restart delay vs. run time. In general, a longer run time produces a shorter restart delay. This feature allows the unit to optimize running and rest times automatically.

Table 12: Automatic Dry-Well Recovery Timer

<table>
<thead>

#RU/ADDR - Restart Attempts (Undercurrent/Underload)/Address. The #RU/ADDR is a dual-function setting. #RU settings are displayed and selected by turning the DISPLAY/PROGRAM knob from approximately the 7 o’clock to 12 o’clock position. ADDR settings are displayed and selected by turning the DISPLAY/PROGRAM knob from approximately the 12 o’clock to 5 o’clock position.

#RU is the number of restarts the unit will attempt after undercurrent/low power fault before the unit locks out and requires a manual reset. #RU can be set to 0, 1, 2, 3, 4, or A. This counter is cleared one minute after restarting if the unit does not trip again on undercurrent/low power.

If #RU is set to “0”, the unit will require manual resetting after all undercurrent/low power faults.

If #RU is set to “A”, the unit will always automatically restart after undercurrent/low power faults, once the RD3 timer expires.

ADDR is the RS-485 address of the unit and is only used when communicating with any external communication device. The address can be set from A01–A99.

#RF/COM - Restart Attempts (other faults)/Communications Settings. The #RF settings are displayed and selected by turning the DISPLAY/PROGRAM dial from approximately the 7 o’clock to 12 o’clock position. COM settings are displayed and selected by turning the DISPLAY/PROGRAM dial from approximately the 12 o’clock to 5 o’clock position.

#RF is the number of restarts the unit will attempt after current unbalance or current single-phase faults before the unit locks out and requires a manual reset. This counter will be cleared one minute after restarting if the unit does not trip again for the same fault condition. Available settings are 0, 1, 2, 3, 4 and A, or to include overcurrent faults, #RF can be set to oc1, oc2, oc3, oc4 or ocA.

If #RF is set to “0”, the unit will require manual resetting after all current unbalance, current single-phase and overcurrent faults.

If #RF is set to “A”, the unit will always restart automatically after current unbalance and current single-phase faults, once the RD2 timer expires. Overcurrent faults will require a manual reset.

If #RF is set to “ocA”, the unit will always restart automatically after current unbalance, current single-phase and overcurrent faults, once the RD2 timer expires.

COM determines the baud rate, even/odd/no parity, and stop bit. COM can be set to C00-C07. C00 and C04 are duplicates provided for backward compatibility.

- C00 = 9600 baud, No parity, and 1 stop bit
- C01 = 9600 baud, Odd parity, and 1 stop bit
- C02 = 9600 baud, No parity, and 1 stop bit
- C03 = 9600 baud, Even parity, and 1 stop bit
- C04 = 19200 baud, No parity, and 1 stop bit
- C05 = 19200 baud, Odd parity, and 1 stop bit
- C06 = 19200 baud, No parity, and 1 stop bit
- C07 = 19200 baud, Even parity, and 1 stop bit

PWS - Power Scale (for KW/HP versions). The PWS setting for the respective LP range is shown in Table 13 below. Settings 1-4 will allow the LP setting to display in kW. Settings 5-8 will allow the LP setting to display in hp.

Table 13: PWS

Three-Phase Pump Protection
777-P2 / 777-KW/HP-P2 SERIES INSTALLATION INSTRUCTIONS

UCTD - Undercurrent Trip Delay (for non-KW/HP version). The length of time, in seconds (default), the unit will allow the motor to run in an undercurrent situation before de-energizing its relay. Typically, UCTD is set to 2-4 seconds to allow for motor to reach full load.

GF - Ground Fault. The maximum allowable current that can flow to ground before the unit de-energizes its relay. This is a residual, class II ground fault system and should not be used for personnel safety. A typical setting for GF is 10-20 % of motor FLA (in amperes). GF may be set to oFF if this feature is not desired. The GF test procedure in the installation instruction manual must be conducted before the device is brought online.

Operation
The relay operation of the units are designed to be fail-safe. This means when the voltage is within the programmed limits, the relay will energize—the NO contact will close and the NC contact will open. When the unit loses power or senses a fault condition, the relay will de-energize and contacts will return to their original state. Once the unit has been installed and programmed, the unit is ready to operate.

Turn MODE SELECT to the RUN position. The display will show “run” alternating with a number (the number displayed will be the number corresponding to where the DISPLAY/PROGRAM knob is pointed). It will do this for the restart delay time programmed into RD1. Once the timer expires, the relay will energize—the NO contact will close and the NC contact will open if the voltage is within the set parameters. If something other than this is displayed, see the troubleshooting section on page 31 for more information. If MODE SELECT is taken out of RUN, the unit’s relay will de-energize.

System Display
On power up, the unit will show the current software revision. For example if the software revision is 33.04, the unit will show 033 followed by 004.

The output display can show one of the following parameters when MODE SELECT is in RUN: L1-L2, L2-L3, and L3-L1 line voltage; %VUB; A, B, and C phase current; %CUB; measured GF current, and KW and HP on KW/HP version. The display is used for programming the operating parameters of the device and also identifies what caused the unit to de-energize its relay or what is keeping the unit from energizing its relay, and under normal operating conditions, what the last fault was. The last fault can be displayed by pressing and holding the RESET/PROGRAM button while MODE SELECT is in RUN. When the unit trips off or is holding the motor off, the current fault condition will be shown in the display without pressing the button (CAUTION: pressing the reset button at this time will reset the unit).

Table 14 lists the fault codes the unit could display.

Troubleshooting

The unit will display a fault code alternating with a number or with “run” when it has tripped. If the unit is showing a fault code alternating with “run,” it is timing down the restart delay. If the fault code is alternating with a number (voltage reading or zero), the unit will not allow the motor to start because there is a problem with the incoming voltage. If the display is showing just a fault code, the unit is in a manual reset mode. This could be because the number of restarts (#RF, #RU) has expired or is not allowed. If the display reads “oFF,” a stop command was issued through the communications network or a remote monitor.

Table 15: Troubleshooting Chart

<table>
<thead>
<tr>
<th>PROBLEM</th>
<th>SOLUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>The unit will not start. Display alternates “rP” with the DISPLAY/PROGRAM parameter value.</td>
<td>The voltage inputs are reverse-phased. If this is the initial start-up, swap any two of the leads connected to L1, L2, or L3 on the unit to correct the problem. If the unit has been previously running, the power system has been reverse-phased. Check the phase sequence of the incoming power lines. Note: L1 must be tapped from conductor Phase A, L2 from B, and L3 from C for correct power factor measurements on remote communications.</td>
</tr>
<tr>
<td>The unit will not start. Display alternates “SP”, “ub”, “HI”, or “Lo” with the DISPLAY/PROGRAM parameter value.</td>
<td>The incoming voltage is not within the limits programmed in the VUB, HV, and LV settings. Turn the DISPLAY/PROGRAM knob to read each incoming line voltage value. Correct the incoming power problem and check programmed limits by turning the MODE SELECT knob. Compare incoming values for HV, LV, and VUB to setpoints to verify they are correct.</td>
</tr>
<tr>
<td>Display alternates “SP”, “ub”, or “oc” with “run”</td>
<td>The unit has tripped on the fault shown on the display and is timing down RD2 before restarting. No further action is required.</td>
</tr>
<tr>
<td>Display alternates “uc” with “run”</td>
<td>The unit has tripped on undercurrent and is counting down RD3 before restarting. If undercurrent is not a normal condition for this application, check for broken shafts, belts, or closed valves or loss of liquid.</td>
</tr>
<tr>
<td>Display is showing a solid “SP”, “ub”, or “oc”</td>
<td>The unit has tripped on the fault shown and a manual reset is required because of the programmed setting in #RF. Check the system for problems that would produce the single-phase, overcurrent or current unbalance fault, such as a jam.</td>
</tr>
<tr>
<td>Display is showing a solid “uc”</td>
<td>The unit has tripped on current single-phasing, but was not single-phased by the incoming voltage. Check for damaged contacts or loose or corroded wiring connections.</td>
</tr>
<tr>
<td>Display is showing a solid “CF”</td>
<td>A ground fault current greater than the programmed GF value has been detected. Check the motor for insulation breakdown. A manual reset is required to clear this message. Press the RESET/PROGRAM button to perform a manual reset.</td>
</tr>
<tr>
<td>Display is showing a solid “GrF”</td>
<td>The unit has tripped on low power (LPr) and is timing down RD3 before restarting. If LPr is not a normal condition for this application, check for broken shafts, belts, or closed valves or loss of liquid.</td>
</tr>
<tr>
<td>Display alternates “LPPr” with “RUN”</td>
<td>The unit has tripped on low power and a manual reset is required because of the setting in #RU. Check the system for problems that would produce a loss of load or a pump is out of liquid. Press the RESET/PROGRAM button to perform a manual reset.</td>
</tr>
<tr>
<td>Display is showing a solid “LPPr”</td>
<td>The unit has tripped on undercurrent and a manual reset is required because of the setting in #RU. Check the system for problems that would produce an undercurrent condition like a dead-head or a lack of liquid to the pump.</td>
</tr>
<tr>
<td>Display alternates “UCo” with “RUN”</td>
<td>The unit has tripped on high power and is timing down RD2. Check for a high power condition.</td>
</tr>
<tr>
<td>Display is showing solid “UCo”</td>
<td>The unit has tripped on high power and requires a manual reset because of the setting in #RF. Press the RESET/PROGRAM button to perform a manual reset.</td>
</tr>
<tr>
<td>Display alternates “CLo” with “RUN”</td>
<td>The unit has tripped on low control voltage (CLo) and is timing down RD2 before restarting.</td>
</tr>
<tr>
<td>Display is showing solid “CLo”</td>
<td>The unit has tripped on low control voltage (CLo) and a manual reset is required because of the setting in #RF. Verify system voltage is correct. Press the RESET/PROGRAM button to perform a manual reset.</td>

Liquid Level Protection
460-15-100-LLS

Liquid Level Sensor

Description
The 460-15-100-LLS is a liquid level sensor to detect the presence of conductive liquids. A probe is mounted at the desired tank level and connected to the Littelfuse Pump Protection Relay. When the probe is submerged, the relay's output contacts will change state as soon as the debounce time expires. The adjustable debounce timer is intended to prevent nuisance actuating due to waves or splashing in the tank.

Relay logic can be inverted so the relay's output contacts change state when the probe is no longer submerged. This makes the unit versatile for use in pump-up and pump-down applications.

Specifications

Input Characteristics
- Control Voltage: 110/120 V ac nominal
- Frequency: 50*60 Hz
- Sensitivity: 100 kΩ

Functional Characteristics
- Probe Sense Voltage: 5 V dc pulsed
- Debounce Time Delay: 2-60 seconds

Output Characteristics
- Output contact Rating: (Two Form A - SPST)
- Pilot Duty: 360 VA @ 240 V ac
- General Purpose: 8 A @ 240 V ac

General Characteristics
- Ambient Temperature Range: Operating: -20 °C to 70 °C (-4 °F to 158 °F), Storage: -40 °C to 80 °C (-40 °F to 176 °F)
- Maximum Input Power: 2 W
- Class of Protection: IP20, NEMA 1 (finger safe)
- Relative Humidity: 10-95 %, non-condensing per IEC 68-2-3
- Terminal Torque: 4.5 in.-lbs.
- Wire: 12-20 AWG
- Standards Passed: Electrostatic Discharge (ESD) IEC 61000-4-2, Level 3, 6 kV contact, 8 kV air
- Radio Frequency Immunity, Radiated: 1500 MHz, 10 V/m
- Fast Transient Burst: IEC 61000-4-4, Level 3, 3.5 kV input power and controls

Surge
- IEC: IEC 61000-4-5, Level 3, 4 kV line-to-line; Level 4, 4 kV line-to-ground
- ANSI/IEEE C62.41 Surge and Ring Wave Compliance to a level of 6 kV line-to-line

Hi-Potential Test
- Meets UL 508 (2 x rated V + 1000 V for 1 min.)

Safety Marks
- cULus UL 508 (File #E68520)
- CE IEC 60947

Enclosure
- Polycarbonate

Dimensions
- H: 88.9 mm (3.5”), W: 52.93 mm (2.08”), D: 59.69 mm (2.35”)
- Weight: 1 lb. (16 oz., 453.59 g)
- Mounting Method: 35mm DIN rail or Surface Mount (#6 or #8 screws)

*Note: 50 Hz will increase all delay timers by 20 %

Expertise Applied | Answers Delivered
Littelfuse.com/Pump-Protection © 2019 Littelfuse Fresh Water Pumping
**Operation**

When a conductive liquid makes contact with the probe it will cause the relay to change state after the debounce time is satisfied. The Run LED indicates that liquid is not present, and the Stop LED indicates that liquid is present.

**Settings**

1. **Debounce Adjustment:**
   This adjusts the amount of time that a conductive liquid is in contact with the probe before the relay changes state.
   **Note:** If the time dial is changed, the new setting will take effect immediately, minus any time that has already elapsed.

2. **Logic Jumper:**
   **Logic Jumper Installed:** Relay closes when conductive liquid is in contact with the probe.
   **Logic Jumper Removed:** Relay opens when conductive liquid is in contact with the probe.
### Liquid Level Protection

**PC-XXX-LLC-CZ / PC-XXX-LLC-GM SERIES**

#### Liquid Level Control Relays

![Image of liquid level control relay](image)

**Description**

The PC-XXX-LLC-CZ & PC-XXX-LLC-GM are liquid level control relays used to control conductive liquid pumping operations in a pump-up or pump-down application. The units come in two different voltage ranges (see specs on adjacent page).

The units have an adjustable sensitivity knob (4.7 k to 100 k ohms) that is set according to the resistance level at which you want the (user supplied) probes to sense the conductive liquid. The units have a built-in debounce time delay that prevents the relay from energizing if the probe resistance momentarily goes above or below the sensitivity setpoint (due to liquid splashing in the tank).

The units operate their internal relay based on inputs from a high and low probe and a common reference (when a conductive tank is used) or common probe (when a non-conductive tank is used).

**PC-XXX-LLC-CZ**
- Compatible with Crouzet’s PNR & PNRU series liquid level control
  - (Direct replacement for Crouzet models: PNR110A, PNR220A, PNRU110A, PNRU220A)

**PC-XXX-LLC-GM**
- Compatible with Gems’ Series 16M general purpose control
  - (Direct replacement for GEMS models: 16MA1A0, 16MB1A0, 16MC1A0, 16MD1A0, 16ME1A0, 16MA2A0, 16MB2A0, 16MC2A0, 16MD2A0, 16ME2A0, 16MK1A0, 16ML1A0, 16MM1A0, 16MN1A0, 16MP1A0, 16MK2A0, 16MM2A0, 16MN2A0, 16MP2A0)

TYPICAL WIRING DIAGRAM FOR PC-XXX-LLC-CZ SERIES

Connections

1. The PC-XXX-LLC-CZ requires an 8-pin socket, part number OT08-PC (sold separately).
2. Mount the socket in a convenient location in or near the pump control panel. If the location is wet or dusty, it should be mounted in a NEMA 4 or 12 enclosure.
3. For pump motor control, connect the normally open contact, socket terminal 3, and common, socket terminal 1, in series with the motor’s magnetic contactor coil (M).
4. Connect the power supply L1 to socket terminal 2 and power supply L2 to socket terminal 7.
5. Connect high level probe to socket terminal 6.*
6. Connect low level probe to socket terminal 8.
7. If the tank is conductive, connect a probe common wire between the tank and socket terminal 5. If the tank is not conductive, a wire must be connected between a reference, or common probe and socket terminal 5.
8. Plug the unit into the socket.

Note: The PC-XXX-LLC-CZ uses a 5 V dc pulse to check the resistance of each probe, so the probes must be isolated from other voltage sources.

* For single probe applications, connect a wire between socket terminals 8 and 5. Connect the single probe between socket terminals 8 and 5. The single probe must be connected to the low probe input and the high probe input must be connected directly to common.
PC-XXX-LLC-GM Installation Instructions

Connections

1. The PC-XXX-LLC-GM requires an 8-pin socket, part number OT08-PC (sold separately).
2. Mount the socket in a convenient location in or near the pump control panel. If the location is wet or dusty, it should be mounted in a NEMA 4 or 12 enclosure.
3. For pump motor control, connect the normally open contact, socket terminal 6, and common, socket terminal 8, in series with the motor’s magnetic contactor coil (M).
4. Connect the power supply L1 to socket terminal 1 and power supply L2 to socket terminal 2.
5. Connect high level probe to socket terminal 3.*
7. If the tank is conductive, connect a probe common wire between the tank and socket terminal 5. If the tank is not conductive, a wire must be connected between a reference, or common, probe and socket terminal 5.
8. Plug the unit into the socket.

Note: The PC-XXX-LLC-GM uses a 5 V dc pulse to check the resistance of each probe, so the probes must be isolated from other voltage sources.

* For single probe applications, connect the single probe between socket terminals 3 and 5. The single probe must be connected to the high probe input and the low probe input must be left open.
Timers & Alternating Relays
T10 SERIES

Solid-State On-Delay Timer

Description
The T10 Series on-delay timer is a solid-state electronic device that provides accurate and reliable timing for control circuits up to 460 V ac. The T10 features a user-selectable time delay from 6 seconds to 10 minutes (0.5 to 12 seconds on the T10S400 model) and SPDT output contacts. When power is applied to the T10, it immediately begins its timing cycle. During this time, the indicator LED alternates between red and green and the output contacts remain inactive. When the timing cycle is complete, the indicator LED turns solid green and the output contacts are activated. The output contacts will remain activated until power is removed from the T10.

The SPDT contact ratings are 480 V @ 240 V ac on the 115 V and 230 V models, and 470 VA @ 600 V ac on the 460 V model.

8-pin Plug-in Alternating Relay

Description
The ALT alternating relays are used to alternate between two loads. The ALT is commonly used in duplex pumping applications to balance the runtime of both pumps.

The ALT-S is used in single high-level float applications. When the float switch opens, the alternating relay changes state, forcing the other pump to run the next time the float closes. All ALT relays have a built-in debounce feature that prevents the relay from changing state if the switch or float contact bounces momentarily.

The ALT-X has an internal cross-connected relay and is used in dual high-level float applications. These floats are commonly referred to as lead and lag floats.

The pumps alternate as in the ALT-S version but the cross-connected relay configuration allows both pumps to run simultaneously when both the lead and lag floats are closed.

These relays are also available with a built-in switch (SW option) that is used to manually force one of the pumps to run every time the float switch is closed. This is helpful when a pump has been removed for repair or for test purposes. In the case of the ALT-X-SW, the switch essentially forces one pump to be the lead pump, while still allowing the second to run when both floats are closed.

Must use the OT08PC socket for UL Rating!

Note: Manufacturer’s recommended screw terminal torque for the OT Series Octal Sockets is 12 in.-lbs.

Accessories

OT08PC Octal 8-pin Socket
8-pin 35mm DIN rail or surface mount. Rated at 10 A @ 600 V ac. Surface mounted with two #6 screws or snaps onto a 35 mm DIN rail.
Specifications

**Input Characteristics**
- Supply Current: 40 mA

**Functional Characteristics**
- Debounce Time Delay: 0.5 second
- Control Input Impedance (min):
  - 24 V: 10 kΩ
  - 115 V: 56 kΩ
  - 230 V: 100 kΩ

**Output Characteristics**
- Output Contact Rating: 480 VA @ 240 V ac

**General Characteristics**
- Temperature Range: -40 °C to 50 °C (-40 °F to 122 °F)
- Maximum Input Power: 5 W

**Safety Marks**
- UL (OT08PC octal socket required)
- CSA
- UL 508 (File #E68520)
- C22.2 No. 14 (File #46510)

**Dimensions (with socket)**
- H: 44.45 mm (1.75”)
- W: 60.33 mm (2.375”)
- D: 104.78 mm (4.125”)

**Weight**
- 0.38 lb. (6.08 oz., 172.67 g)

**Mounting Method**
- DIN rail or surface mount (plug into OT08PC socket)

**Socket Available**
- OT08PC (UL Rating 600 V)

---

The 600 V socket can be surface mounted or installed on DIN rail.

Installation Instructions

**TYPICAL WIRING DIAGRAM FOR THE ALT-S**

---

**TYPICAL WIRING DIAGRAM FOR THE ALT-X (CROSS CONNECTED)**
**Description**

The 50R-400-ALT alternating relays are used to alternate between two loads, most commonly in duplex pumping and compressor applications to balance the runtime of both loads.

When used in single float applications, the alternating relay changes state after the float switch opens*, forcing the other pump to run the next time the float closes. When used in dual float applications, the alternating relay will allow both pumps to run simultaneously when the lead and lag floats are both closed.

An adjustment knob provides the option to force one pump to run every time the float switch is closed. This is helpful when one pump has been removed for repair or for test purposes.

A built-in debounce feature prevents the alternating relay from changing state if the float contact bounces momentarily.

*The alternating relay will not switch states while current is flowing. Switching will only occur after current has been sensed, followed by loss of current for the duration of the debounce time delay.

**Specifications**

**Input Characteristics**

- **Supply Voltage**: 380-480 V ac
- **Supply Current**: 40 mA

**Functional Characteristics**

- **Control Input Impedance (min)**: 1MΩ

Metal Electrical Box

**Description**
The NEMA-3R-L enclosure is a metal electrical box that meets the National Electrical Manufacturers Association's standard for a 3R enclosure (rain proof). The NEMA-3R-L box can house several different single-phase Littelfuse models. It has two clear lenses on the cover for viewing the LEDs on the unit, allowing the customer to determine the units operational status.

The NEMA-3R-L is sold separately.

**Specifications**

**Functional Specifications**

- **Classification**: NEMA 3R standard (rain proof)
- **Grounding**: 12” long 12-gauge wire secured by ground screw

**General Characteristics**

- **Dimensions**
  - H 156.46 mm (6.16”);
  - W 159.26 mm (6.27”);
  - D 117.35 mm (4.62”);
  - **Inside Depth** 101.6 mm (4.0”)
- **Front Cover**: Secured by two machine screws, contains two clear lenses for viewing LED lights on the relay
- **Weight**: 3.30 lbs.
- **Mounting Method**: Surface mount (four pre-drilled concave holes)
- **Knock-outs (four)**
  - ½” (1 each side and 2 in bottom) or
  - ¾” (1 each side and 2 in bottom)
- **Security**: Padlock tab

**Dimensions**

- H: 156.46 mm (6.16”)
- W: 159.26 mm (6.27”)
- D: 117.35 mm (4.62”)
- Inside Depth: 101.6 mm (4.0”)

- FRONT COVER: Secured by two machine screws, contains two clear lenses for viewing LED lights on the relay.
- WEIGHT: 3.30 lbs.
- MOUNTING METHOD: Surface mount (four pre-drilled concave holes)
- KNOCK-OUTS (FOUR):
  - ½” (1 each side and 2 in bottom) or

Accessories
INFORMER

Hand-held diagnostic tool

Description
The Informer is a hand-held diagnostic tool designed for use with single-phase models equipped with infrared LED transmitters (111-Insider-P; 231-Insider-P; 232-Insider; 111P; 233P, 233P-1.5; 234-P; and 235P).

The Informer uses an infrared receiver to access information sent from the relay which can be helpful for troubleshooting the system.

Each Littelfuse single-phase model listed above is equipped with an infrared LED that transmits valuable information from the device. To retrieve this information, the Informer’s receiver must be directed toward the unit’s LED transmitter and be within 8 feet of the unit. The green COMM STATUS light indicates when the Informer is receiving data from the unit. If communication is lost, the Informer will display the last values it received. The Informer will automatically shut off after 2 minutes of non-use.

An infrared adapter (IR Kit-12) is included with all new and updated Informers. This adapter allows communication with the unit without opening the panel door (for select models).

The Informer displays:
- Model number
- Real-time voltage, current, and power
- Drywell and overload trip points
- Calibration voltage
- Restart delay setpoint and restart delay time remaining
- CT size (if applicable)
- Number of pump starts
- Total run-time
- Fault history for last 20, most recent, faults
- Voltage, current, power, and run-time for each fault at time of the fault
- Highest and lowest voltage and current since last calibration

Dimensions

Accessories
Informer IR Kit-12
Attaches to the face of the unit to provide remote diagnostics without opening the panel. (12” infrared adapter cable)
### Specifications

**Functional Characteristics**

**Power**
- **Input**
  - 9 V dc (requires one 9-V alkaline battery)
  - 2 minutes

**Auto Shut-off**
- **Communication**
  - Infrared

**Signal**
- **Range**
  - 1-8 ft. (approx. 0.25 ft. when using IR Kit)
  - 4 seconds

**Data Update**
